

## A4 ACTIVITY 3: ENERGY FROM THE SEA

---

### Background

As the non-renewable energy resources are dwindling, the demand for energy is increasing. Despite over 97% of the Earth being covered by water, using it as a primary source of energy has not really been exploited until now. **Ocean energy** is also referred to as **marine energy**. The movement of the oceans creates a vast store of kinetic energy – waves, tides, temperature differences – all of which can be used to generate electricity. The rhythmic nature of the oceans is more reliable for generating electricity than the unpredictable and random nature of wind.

---

### Suggested approaches:

- Ask the students to compare the advantages of solar energy with those of wind energy. What might the disadvantages be – Is wind energy always available? How can it be used to generate electricity? What about solar energy, can we depend on it? What about the seasons? Could it be too hot for solar panels to work? (You might like to show this video to help the discussion <https://www.youtube.com/watch?v=eiK3tcjJXiA> ). Do the advantages outweigh the disadvantages?  
The following video is an excellent introduction to wave energy, <https://www.youtube.com/watch?v=bEfrtAOMuvk>.
  - How many advantages can the students list for developing ocean energy? What is the source material? What might some of the disadvantages be? Are there any ethical issues to consider – for example, what about marine habitats? Which should have priority, our need for energy or marine life?
  - The two sheets – **A4 ACTIVITY 3 (I) DISCUSSION POINTS: WIND VERSUS SUN** and **A4 ACTIVITY 3 (II) DISCUSSION POINTS: WHY GO TO THE SEA?** – could be used as guidelines for debating the issues, providing students with the opportunity to carry out their own research and then present their arguments.
-
